

Abstract

The **Hospital Management System** is an online tool designed to streamline and automate the scheduling and administration of medical appointments in a medical facility. With the help of this project, hospital administrators will be able to effectively schedule, track, and update patient appointments while keeping accurate records thanks to a digital platform. Moreover, the project offers users a direct message feedback system.

The system's **scope** encompasses a secure login system for authorized admin users, the ability to create appointments using a structured form, the ability to display and manage appointment data in real-time, and the ability to track appointment status (Pending, Accepted, Rejected) along with visit confirmation. The application also shows the number of registered doctors and appointments that are scheduled in real time.

The **objectives** of the project are:

- To digitize and streamline appointment scheduling processes.
- To enable centralized and secure access for hospital staff.
- To reduce manual errors and improve data accuracy.
- To ensure quick status updates for appointments.
- To provide users with a real-time feedback system.
- To enhance the overall efficiency and productivity of hospital operations.

This system is built using **React.js for the frontend, Node.js and Express.js for the backend**, and **MongoDB** for data storage, providing a responsive and scalable solution to hospital appointment management.
